**LIST OF EXPERIMENTS (INDICATIVE)**

1. Using MNIST dataset implement Linear Regression, calculate Gradient and Cost minimum, along with line of best fit
2. Understand Linear Regression and other regression techniques using house prices prediction dataset
3. Use IRIS dataset to illustrate Logistic Regression i.e., the most famous dataset that contains 150 IRIS flowers

4. Train an SVM Classifier on MNIST dataset, since SVM classifier are binary you need to use one versus the rest to classify all 10 digits. Tune the hyper parameters using small validation sets to speed up the process. Show what accuracy you reached?
5. Detecting Spam mails using Support vector machine Train and fine -tune a decision tree for MOONs Dataset by following these steps
  - (1) Use make-moons ( $n\_samples= 1000$  noise =0.4) to generate a moons dataset
  - (2) Use `train_test_split()` to split the dataset into training and testing dataset
  - (3) Use grid search with cross-validation to find good hyper parameter values for a DecisionTree Classifier. Hint: Try various values for `Max_leaf_nodes`
  - (4) Show what accuracy you have reached
6. Grow a forest by following these steps:
  - (1) Generate 1000 subsets of MOONs Dataset each subset should contain 100 instances selected randomly. Hint: Use Scikit- Shuffle Split class
  - (2) Evaluate these 1000 decision tree on the tests set. Since they were trained on smaller set, these Decision Trees will likely perform worse, Show the Accuracy
  - (3) Now comes the magic, For each test set instance, Generate the prediction of 1000 Decision Trees and keep only the most Frequent prediction use SciPy's `Mode()` function. This Approach gives you *Majority-vote prediction* over the test set
  - (4) Evaluate these predictions on the test set: show the accuracy
7. Load MNIST Dataset and train various classifiers like, random forest, Extra tree classifiers , SVM and try to combine them on Ensemble that outperform each individual classifier on the validation set, using soft or hard voting. Classify how much better does it perform as compared to Individual classifier
8. Use t-SNE to reduce the MNIST dataset down to 2-dimesions and plot the results using Matplotlib. You can use scatterplot using 10 different colors to represent each image target class. Alternatively, you can replace each dot in the scatterplot with the corresponding instance's class. Plot scaled-down version of digits images also. Do the same for other reduction algorithms such as PCA, LLE or MDS and compare the resulting visualization
9. Load the classic OLLIVETTI faces dataset split the dataset into a training set, a validation set and test set. Since dataset is small, you probably want to use Stratified sampling to ensure that there are same number of images per person, Next cluster the images using K-Mean. Now use K-mean as Dimensionality reduction tool, train the classifier on reduced set. Search for the number of clusters that allows the classifier to get the best performance
